[Example input data for each field from a temperature logging system. In order to analyse the data in a shorter period, a data compression method is applied to each value, and the data is split into ranges, marked in gray. The resulting data are then sent to the cyber-physical system (CPS) to process.](sensors-18-01664-g001){#sensors-18-01664-f001} !

[Block diagram of the developed algorithm, which consists of two parts. Firstly, data that have been collected are split into different ranges based on the timestamps, which also makes sure that only values that have been collected in a short period of time are sent to the cloud. Secondly, anomaly detection is performed in the cloud using an algorithm which consists of two models, anomaly detection model and normal model.](sensors-18-01664-g004){#sensors-18-01664-f004} !
